

Javascript! Execution Context

→ How run your js file by javascript

 → Global execution (EC) context

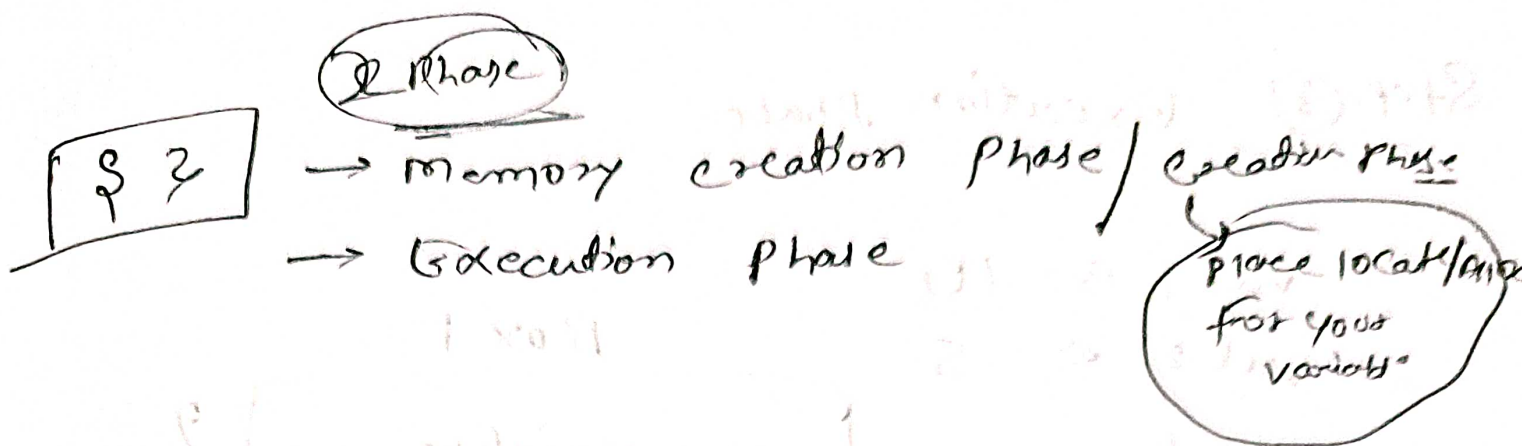

this is not a variable

but in browser windows it is

⇒ it all happen inside a single thread

- ↳ Global EC
- ↳ Function/functional EC
- ↳ Eval EC

⇒

→ Example:

```
let val1 = 10
let val2 = 5

function addNum(num1, num2) {
  let total = num1 + num2
  return total
}

let result1 = addNum(val1, val2)
let result2 = addNum(10, 2)
```

Step ① At first come to E/global environment
8 + 9 + locate in this

Step ② Creation phase / mp

1st cycle

~~the~~ Allocate memory of all variable

- val1 = undefined → ①
- val2 = undefined → ②
- addNum → definition (fⁿ and defⁿ) → ③ \$X\$
- result1 → undefined
- result2 → undefined

Step-③ Execution phase

val 1 \leftarrow 10

val 2 \leftarrow 5

add num \rightarrow

result $= 15$

Box 1

new variable
environment
+
Execution
thread

for
(X)

then step ② &

③ again will
start running
we execute any
f.m.

memory phase

val 1 \rightarrow undefined

val 2 \rightarrow undefined

total \rightarrow undefined

Execution Context

num 1 \rightarrow 10 (val)

num 2 \rightarrow 5

total \rightarrow 15

\rightarrow it return to global EC (*)

\rightarrow after completion

Box 1

is deleted if they
same for
next step

Call Stack

but if

~~(three())~~

one (two (three())) then
